

An innovative technology allows us to divide the pack horizontally, creating two completely separated layers, with the possibility of packing together products with completely different needs. So moisture migration and different gas mixtures can be defined in each single layer, opening the opportunity to create meal assembly with enhanced quality or create two singles packs in one tray.

- ✓ **Two individually sealed products within the same tray both MAP protected**
- ✓ **Overall pack weight reduction**
- ✓ **Gas mixes can be varied for the two compartments**
- ✓ **Eliminates the need of reclosability**
- ✓ **Perfect pack for promotional activity: buy one get one free can be done in the same pack saving one tray**

## Ideal combination for snacks and ready to cook products

The bottom part can be divided into compartments to create a wide choice of meal recipes.

## Maintaining one portion protected in MAP

The pack can be used for the same product in both compartments, ideal for sliced meats, cheese, sausages, etc. where the remaining of the product can be left MAP protected. It eliminates the need of a reclosable pack and allows promotional activity at a marginal increase in packaging costs: just one extra film layer.

## Reduction up to 30% in pack weight

Having the possibility of placing two layers, the tray dimension can be greatly diminished allowing a major reduction in weight per kilo of product.
